Sound That Will Move You

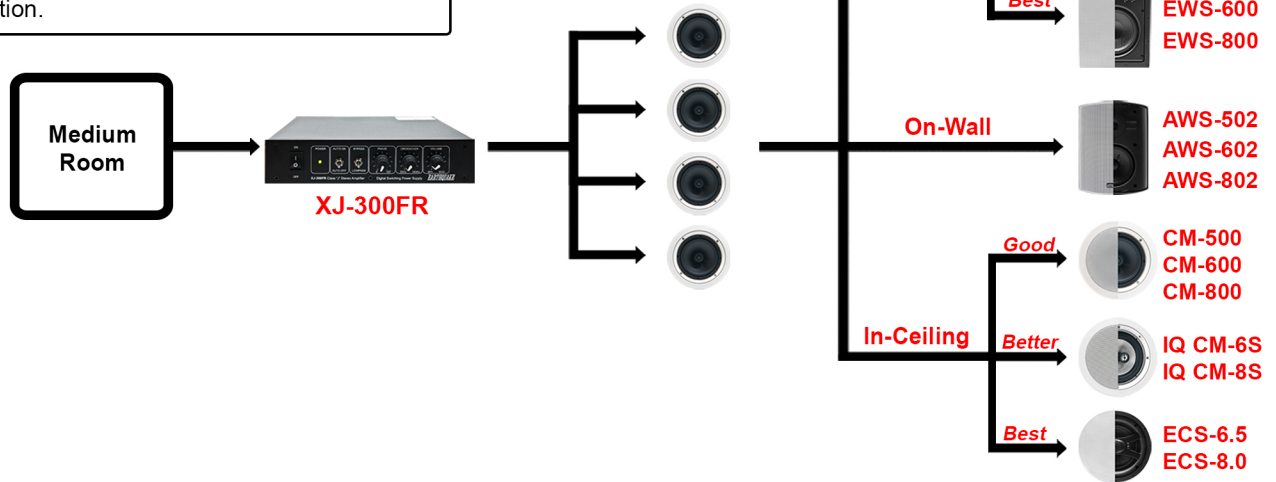

Small room solution - up to 35m²

By following this diagram it is quick and easy to design the perfect sound package every time. All you need to know is the target price and whether it is an on-wall, in-wall or in-ceiling installation.

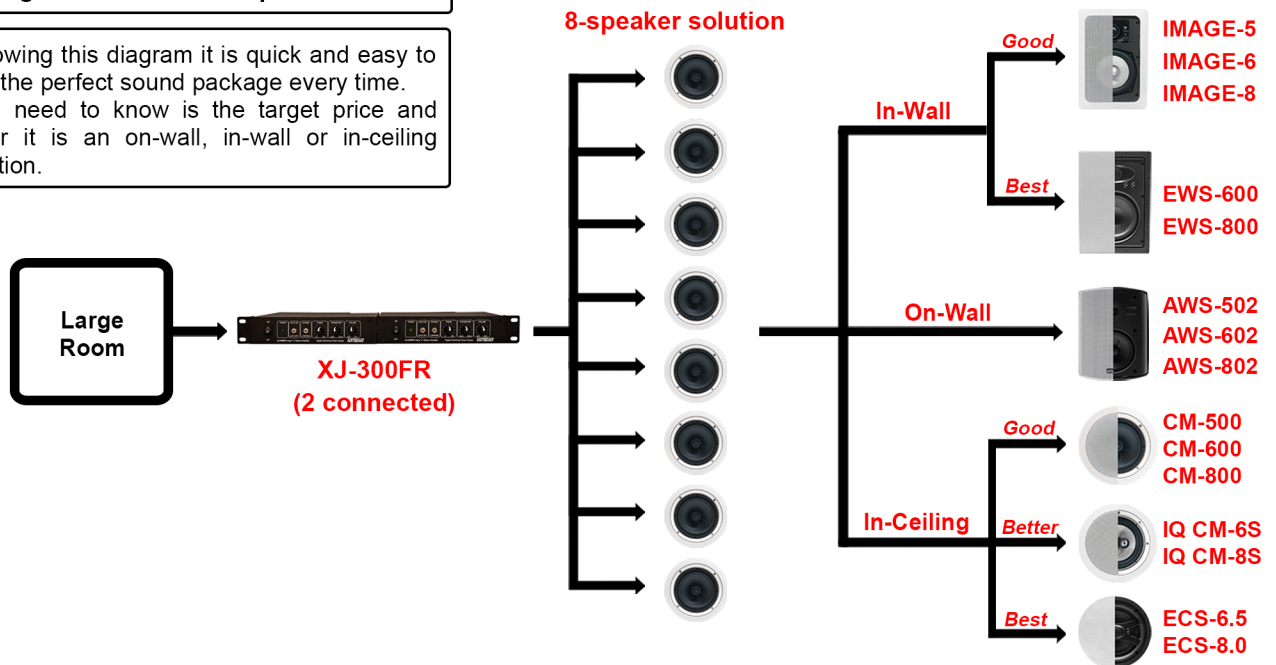

Medium room solution - up to 75m²

By following this diagram it is quick and easy to design the perfect sound package every time. All you need to know is the target price and whether it is an on-wall, in-wall or in-ceiling installation.

Large room solution - up to 200m²

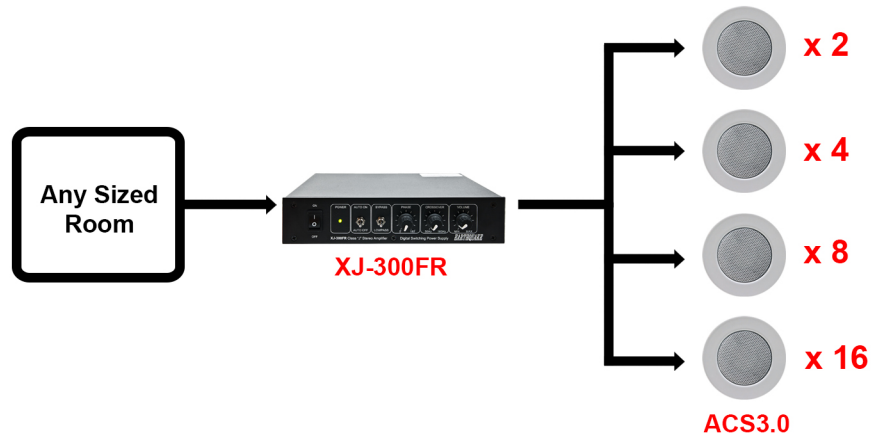

By following this diagram it is quick and easy to design the perfect sound package every time. All you need to know is the target price and whether it is an on-wall, in-wall or in-ceiling installation.

ACS 3.0 - Micro speaker solution for any size room

The **XJ-300FR** amplifier and **ACS3.0** ultra powerful micro speaker can create a scalable high quality audio system. This solution is ideal where the installation does not permit the use of larger traditional speakers.

The ACS 3.0 features a sealed back-box and can be installed in ceiling light cut-outs, in ventilation channels, drilled into woodwork or even in hanging light fixtures. For deep impact bass it is recommended to pair the ACS 3.0 system with a subwoofer like the Earthquake Thor in-wall sub.

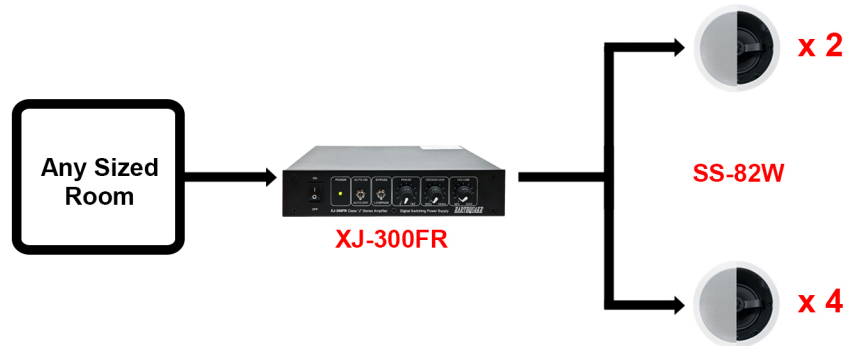

Sweetspot - Special 20° angle sound solution

The **SweetSpot SS-82W** in-ceiling speaker adds unique possibilities to the ceiling speaker category. Whenever directional ceiling sound is desirable, the SS-82W will deliver stunning full spectrum sound.

If installation in the ceiling is only possible around the outer rim of the room as in many older buildings, it can provide excellent full room coverage. It can also be used in a surround sound system as it gives the sound the directionality needed for correct movie sound playback.

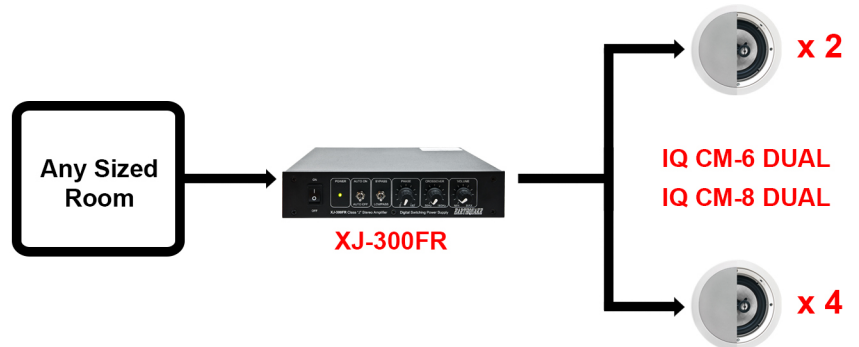

With extended low frequency response to 30 HZ the SS-82W can easily operate without the need of a subwoofer. An SS-82W in each corner of a room will give great coverage with powerful bass response.

Stereo Sound from a single speaker

The **IQ CM** Dual line of speakers create the unique possibility of stereo playback from a single speaker. Its dual tweeter and dual voice coil design plays the full stereo information from two separate channels with a wide and pleasant dispersion. This is ideal for rooms where only one speaker is wanted.

The design also opens up possibilities for many novel implementations: if two separate sound systems are operated in a given area, they can each use one of the inputs on the speaker. If there is a need to have microphone speech overlaid on the music but the line level equipment does not allow for this, the microphone audio can be wired separately to the speaker.

The most powerful In-Wall subwoofer on the market

The **Thor IW-SUB10** in-wall Subwoofer features a unique sealed box design that is only 9cm deep. It does not load the wall cavity like traditional in-wall subwoofers - it is an easy install with no guesswork on part of the installer.

Thundering bass down to 20 HZ and discreet flexible design. Both a metal grill and frames for fabric grills are provided so a perfect custom integration can be accomplished with no extra expense.

The Thor IW-Sub10 can also be mounted in the ceiling or on the underside of furniture.
